

CS280 Programming Assignment 0
Fall 2017
Due Sept 18 before midnight

This assignment is designed to help get you used to the Vocareum system. It will be graded but will be assigned a very small percentage of the overall grade; it is mostly intended to get you going on using Vocareum.

Write a C++ program that loops through all of the command line arguments that are passed to the program. For each argument, you are to test to see if there is a file with that name. [you test by attempting to open the file and checking to see if the open was successful]. Your program should do the following

1. If there is NOT a file with the name given in the argument, print, on a single line, the name of the file, a space, and the string FILE NOT FOUND
2. If there is a file with the name given in the argument, print, on a single line, the name of the file, a space, and an integer representing the number of characters in the file.

You will note that there should be one line of output for each command line argument that is specified.
